

International

Queue Project Centre

BENEFITS

Time & Expense Entry.

- Centralized Time & Expense Entry.
- Time & Expenses can be entered for all companies regardless of the currency.
- Eliminates the need for manual entry of information shared between projects.
- Visibility into real time project hours across all organizations.

Resources.

- Resources can be shared from multiple organizations with multiple currency cost and billing rates.
- Centralized resource allocation.
- Enables users of **Microsoft Office Project Server** to integrate the project planning and portfolio management functions into a comprehensive project accounting solution that handles unlimited currencies.

Projects.

- Allows a customer view of information that is consolidated and “currency translated” automatically, for the office/country – that owns the project.
- The Project accounting solution allows users to accurately assess the ROI of individual projects and enables true performance measurement for projects across all countries.

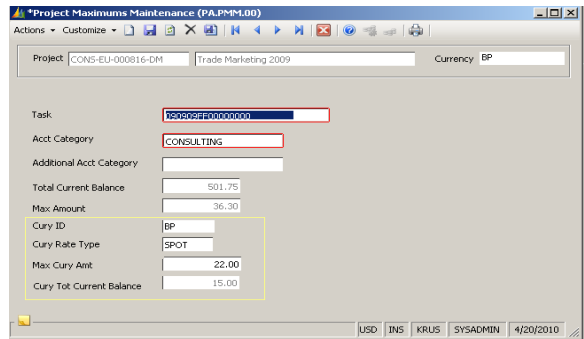

for Microsoft Dynamics SL 7.0 feature pack

This solution is a Multi-Currency, Multi-Company, Multi-National Project Management Solution for Dynamics SL 7. It provides a central repository for all project, budget and resource information that enables a single, detailed view into the operations of international, multi-company and multi-currency project organizations. Project planning, budgeting and tracking are easily setup in a central repository, with automated replication to the various entities throughout the organization so that local offices also have a view into their own project operations and financial accounting.

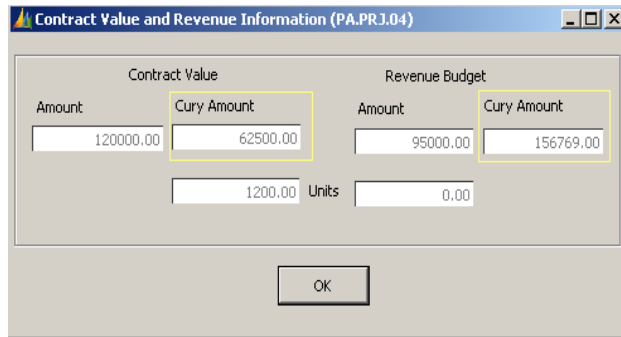

Project Maintenance (PA.PRJ.00) - New fields have been added to the Project maintenance Screen to identify whether the project will be shared with other companies, the owning company for the project, project currency and the Budget Rate type. This information will be used when translating the Budget Amounts to and from currencies for this project throughout SL.

Enhancements

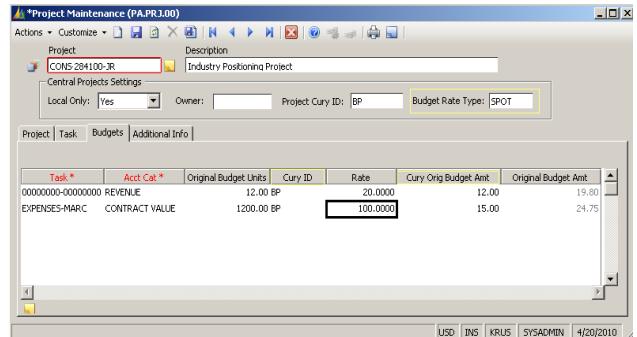

Utilizing the project accounting based modules in Microsoft Dynamics SL 7.0, Queue Project Centre enhances the accounting flow of information by allowing multiple offices, in multiple countries, with multiple currencies enter budgets, actual, time and expenses on a shared project across the organization. Project planning, budgeting and tracking are easily setup in a central repository, with automated replication to the various entities throughout the organization.

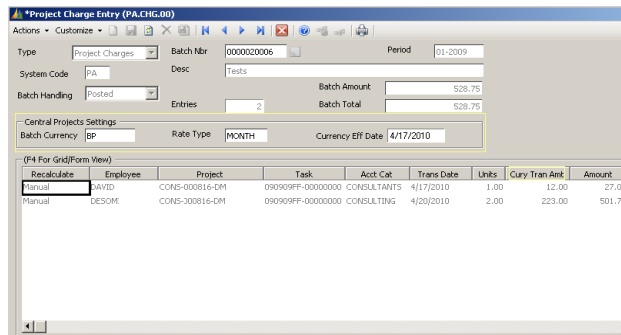

Project managers are able to calculate actual versus budgeted cost variances using project accounting. As revenue, costs, activities and labors are accurately tracked and measured, project accounting provides future benefits to the organization.

Resources can be shared from multiple organizations with multiple currency cost and billing rates enabling effective resource management across the entire worldwide organization. This keeps all financial data in an office's respective operating currency – but gives us great power in allowing a customer to view the information consolidated and “currency translated” automatically, for the office/country – that owns the project.

Queue Project Centre allows users to accurately assess the ROI of individual projects and enables true performance measurement for projects across all countries. Users will increase profitability by optimizing utilization and minimizing down time, with up-to-date visibility of project and resource performance in terms of time and budget.
